Cyberattack on BAE Systems takes down US federal bankruptcy court notice system

The US Administrative Office of the Courts says a cyberattack on contractor BAE Systems has taken down the notice system used by federal bankruptcy courts.

- The Administrative Office of the US Courts reported the incident.
- The target was BAE Systems, a government contractor.
- The attack took down the notice system used by federal bankruptcy courts.
- The source excerpt gives no further detail on cause, scope or recovery.

The Administrative Office of the US Courts has said that a cyberattack on the government contractor BAE Systems took down the notice system used by federal bankruptcy courts.

What is known

The available source text is brief. It identifies the affected contractor, the court body that reported the problem, and the service that was disrupted: the notice system serving federal bankruptcy courts. It does not describe the attack method, the attacker, the data involved or when services are expected to return.

Why it matters for regulated institutions

The incident is an example of how a disruption at a single supplier can interrupt a public service that other organisations depend on. For institutions in the Kingdom, the lesson is about third-party dependency rather than about this specific event: critical processes often rely on services run by contractors, and an outage at the supplier becomes an outage for the customer.

Because details are limited, avoid drawing conclusions about cause or impact until the courts or the contractor publish more information.

Practical stance

Use the news as a prompt to review how your own supplier relationships would hold up under a similar event, and to confirm that notification, fallback and recovery arrangements are documented and tested.

What to do now

1. Identify which critical services depend on third-party contractors and record each dependency.
2. Check that supplier contracts require prompt incident notification and define service-restoration expectations.
3. Confirm manual or alternative procedures exist for services that rely on a single supplier platform.
4. Include a supplier-outage scenario in your next business continuity and incident response exercise.
5. Monitor official updates on the incident before drawing conclusions about its cause or impact.
