Dark Reading roundup flags Nvidia CEO resignation and a Microsoft cloud outage

A Dark Reading video roundup mentions Jensen Huang's resignation from Nvidia and a recent Microsoft cloud outage. The source gives no further detail, so institutions should rely on primary sources.

- Dark Reading editors discussed stories they had not covered in full.
- One item is Jensen Huang's resignation from Nvidia.
- Another is a recent Microsoft cloud outage.
- The source gives no causes, dates, scope or impact for either item.

What the source says

Dark Reading published a video in which its editors review news they did not have time to cover in depth. Two items are named in the description: the resignation of Jensen Huang from Nvidia, and a recent cloud outage at Microsoft.

The description is brief. It does not explain the reasons behind the resignation, when either event occurred, which Microsoft services or regions were affected, or how long the outage lasted. We therefore make no claims beyond these two points.

Why it matters for risk teams

Even with limited detail, both items touch themes that regulated institutions track: leadership change at a major technology supplier, and availability of a large cloud provider. Neither should be assessed on a media summary alone.

A sensible approach is to treat this as a prompt to confirm that existing supplier and resilience arrangements are current, then wait for official statements from the companies concerned before drawing conclusions about impact on your own environment.

What to do next

Check whether your organisation uses Microsoft cloud services and whether any incident was recorded on your side. Review the vendor's own incident communications, and confirm that your continuity plans for cloud dependency are tested and understood by service owners.

What to do now

1. Check internal incident logs for any disruption to Microsoft cloud services in the recent period.
2. Read the vendor's official incident communications before reporting impact internally.
3. Confirm business continuity plans for cloud dependency are current and tested.
4. Review critical supplier registers for reliance on Nvidia products and note any official statements.
